KEYWORDS: Biodiversity, ecological informatics, functional trait ecology, global change, macroecology, species interactions

BIOSKETCH: I am an Associate Professor of Quantitative Biodiversity Science at the University of Amsterdam, the Netherlands. I am also working as a scientific coordinator of the Virtual Laboratory Innovation Center (LW-VLIC) of LifeWatch-ERIC, a European Research Infrastructure Consortium established by the European Commission to provide e-Science research facilities to biodiversity and ecosystem scientists. My main interest is in data-intensive biodiversity science, especially in the fields of macroecology, biogeography, biodiversity monitoring and global change (past, present, future). In my work I aim to understand what determines the broad-scale distribution of biodiversity, i.e. taxonomic, functional, phylogenetic and interaction diversity across space and time. I am particularly interested in the way how environmental factors, species interactions, functional traits, human impacts, and evolutionary history influence species distributions and the structure and assembly of biological communities. In most of my work, I take advantage of recent developments in technology, computing, statistics, data availability, and ecological modelling. I am also interested in the interoperability of biodiversity research infrastructures and other aspects of data science (e.g. data and metadata standards, workflows for data integration, controlled vocabularies, semantics). I supervise BSc, MSc and PhD students and Postdocs and I teach courses, coordinate research projects, and take responsibility in national and international committees and organisations.
